

# GLOBAL WARMING

## THE MELTING OF GLACIERS

Do you feel that snow is becoming more and more rare on the ski slopes? It may not be an illusion.

In our opinion melting glaciers is dangerous for animals that live on the ice floe global warming is the consequence of pollution due to human activities.

The warming of the earth causes a lot of problems. The temperature is rising and ice blocks are coming off the glaciers, forming icebergs.

Because of global warming many animals see their natural habitat disappear over the years. To save animals we have to take care of our environment to avoid melting glaciers because the melting of glaciers causes the rise of the oceans.

But according to us we do not have to pollute nature or hunt its inhabitants. Unfortunately, men do not realize the harm they are doing to the planet.

Global warming is a real problem for nature that must be solved for the good of humanity.

# The rise of ocean

The rise of the oceans is due to the melting of glaciers caused by global warming; which is a very worrying subject. The land can no longer absorb the amount of water which causes floods in cities, agricultural land, and soon the disappearance of some land. Because of the melting of glaciers, the animals leave their habitat and get closer to the villages in search of food (example: the polar bear). in these villages, the population that lives there is called Inuit.
